

DIY Water-Retentive Soil Mix

What You Need:

- 1 part organic potting soil with worm castings
- 1 part organic rotted composted manure
- 1 part plain compost

Directions:

Mix all 3 parts together in a five-gallon bucket. Add the mixture to your garden beds or containers as needed to create a drought-resistant soil mixture.

Simply top dress as needed.

Why This Works: The three ingredients act as a complete compost providing everything your plants may need to help thrive in drought conditions.
